Norms: Establishing a Culture of Learners

- Please keep your camera on, if possible.
- Take some time to orient yourself to the platform
 - "where's the chat box? what are these squares at the top of my screen?, where's the mute button?"

Mute your microphone to reduce background noise unless sharing with the group

The chat box is available for posting questions or responses to during the training

Make sure you have a note-catcher present

Be an active participant - chat, ask questions, discuss, share!

Workshop goals

By the end of this workshop, you will be able to:

- Internalize your upcoming unit.
- Plan for collecting **evidence of student learning** in order to make instructional decisions to **support diverse learner needs**.
- Gather resources to develop a multi-day plan for implementing Amplify Science within your class schedule and instructional format.

Unit Guide resources

Once a unit is selected, select JUMP DOWN TO UNIT GUIDE in order to access all unit-level resources in an Amplify Science unit.

Unit Overview	Describes what's in each unit, the rationale, and how students learn across chapters
Unit Map	Provides an overview of what students figure out in each chapter, and how they figure it out
Progress Build	Explains the learning progression of ideas students figure out in the unit
Getting Ready To Teach	Provides tips for effectively preparing to teach and teaching the unit in your classroom
Materials and Preparation	Lists materials included in the unit's kit, items to be provided by the teacher, and briefly outlines preparation requirements for each lesson
Science Background	Adult-level primer on the science content students figure out in the unit
Standards at a Glance	Lists NGSS Standards (Performance Expectations, Science and Engineering Practices, Disciplinary Core Ideas, and Crosscutting Concepts), Common Core State Standards for English Language Arts, and Common Core State Standards for Mathematics
Teacher references	
Lesson Overview Compilation	Lesson Overview of each lesson in the unit, including lesson summary, activity purposes, and timing
Standards and Goals	Lists NGSS (Science and Engineering Practices, Disciplinary Core Ideas, and Crosscutting Concepts) and CCSS (English Language Arts and Mathematics) standards in the unit, explains how the standards are reached
3-D Statements	Describes 3-D learning across the unit, chapters, and in individual lessons
Assessment System	Describes components of the Amplify Science assessment system, identifies each 3-D assessment opportunity in the unit
Embedded Formative Assessments	Includes full text of formative assessments in the unit
Articles in This Unit	Summarizes each unit text and explains how the text supports instruction
Apps in This Unit	Outlines functionality of digital tools and how students use them (in grades 6-8)
Flextensions in This Unit	Summarizes information about the Hands-On Flextension lesson(s) in the unit
Printable resources	
Coherence Flowcharts	Visual representation of the storyline of the unit
Copymaster Compilation	Compilation of all copymasters for the teacher to print and copy throughout the unit
Flextension Compilation	Compilation of all copymasters for Hands-on Flextension lessons throughout the unit
Investigation Notebook	Digital version of the Investigation Notebook, for copying and projecting
Multi-Language Glossary	Unit vocabulary words in 10 languages
IGSS Information for Parents and Guardians	Information for parents about the NGSS and the shifts for teaching and learning
Print Materials (8.5" x 11")	Digital compilation of printed cards (i.e. vocabulary cards, student card sets) provided in the kit
Print Materials (11" x 17")	Digital compilation of printed Chapter Questions and Key Concepts provided in the kit

Rock Transformations Planning for the Unit

Unit Map

Unit Map

Why are rock samples from the Great Plains and from the Rocky mountains composed of such similar minerals, when they look so different and come from different reas?

Taking on the role of student geologists, students investigate a geologic puzzle: two rock samples, one from the Great Plains and one from the Rocky Mountains, look very different but are composed of a surprisingly similar mix of minerals. Did the rocks from together and somehow get split lapart? Or did one rock from first, and then the other rock form from the materials of the first rock? To solve the mystery, students learn about how rock forms and transforms, driven by different energy sources.

Chapter 1: How did the rock of the Great Plains and the rock of the Rocky Mountains form?

Students figure out: The rock of the Great Plains is sedimentary rock and the rock of the Rocky Mountains is igneous rock. They formed in different ways so they must not have formed together. Rocks can form in different ways. This causes them to be different types. When sediment is compacted and cemented together, it forms sedimentary rock. When magna could, it hardness to form igneous rock.

How they figure It out: They observe rock samples and explore the Simulation, finding different ways to make rock form. They model the formation of salmentary rocks using hard candy, and view a vides obwing igneous rock formation as magma costs. They create a visual model showing two different ways rocks can form. They evaluate evidence based on how detailed observations are.

Chapter 2: Where did the magma and sediment that formed the rock of the Great Plains and the rock of the Rocky Mountains come from?

Students figure out: It is possible that the rock of the Great Plains formed from sadiment that ended off the Rocky Mountains. It might also be possible that the rock of the Rocky Mountains formed from the rock of the Great Plains if the Great Plains rock were somehow carried underground to where energy from Earth's interior could mell it into magma. Matter gets transformed by energy, but the same matter is still present. Sedement froms when any type of rock is weathered, a process driven by energy from the sun. Magma forms when any type of rock is melted, a process driven by energy from Earth's interior.

How they figure if out: They find ways to cause magma and sediment to form in the Sim, then observe which of these processes are driven by energy from the Sun and which are driven by energy from Earth's interior. They watch the observe which of these that illustrates the processes of weathering and erosion. They read an article about the geologic history of Devils Tower. They model the formation of sodiment using hard candy, and watch a video demonstration of a hard candy model magma formation. They write about ways that different energy sources affect tock and create new visual models. They read and conduct bit or tocks in Hawaii in order to review hard hard process.

Part 1: Unit-level internalization

Unit title: Rock Transformations

What is the phenomenon students are investigating in your unit?

A rock sample found in the Great Plains and a rock sample found in the Rocky Mountains look different but are composed of a surprisingly similar mixture of minerals.

Unit Question:

How do rocks form and change?

Student role:

Student geologists

By the end of the unit, students figure out ...

Due to plate motion, the two rock samples came to the surface together as igneous rock (which is why they have similar mineral composition). Some of this rock was exposed to energy sources at the surface, and it transformed and moved, forming sedimentary rock in the Great Plains. Some remained in the Rocky Mountains as igneous rock.

What science ideas do students need to figure out in order to explain the phenomenon?

Rock Transformations

Planning for the Unit

Progress Build

Progress Build

Each Amplify Science Middle School unit is structured around a unit specific learning progression, which we call the Progress Build. The unit's Progress Build secrotes the way student's explanatory understanding of the unit's focal phenomena is likely to develop and deepen over the course of a unit. It is an important tool in understanding the structure of a unit and in supporting students' learning: if organizes the sequence of instruction (agenerality, each level of the Progress Build corresponds to a chapter), defines the focus of assessments, and grounds the inferences about student learning progress that guide suggested instructional adjustments and differentiation. By aligning instruction and assessment to the Progress Build (and therefore to each other), evidence blout how student understanding is developing may be used during the course of the unit to support students and modify instruction in an informed way.

The Rock Transformations Progress Build consists of three levels of science understanding. To support a growth model for student learning progress, each level encompasses all of the ideas of prior levels and represents an explanatory account of unit phenomena, with the sophistication of that account increasing as the levels increase. At each level, students add new ideas and integrate them into a progressively deeper understanding of how rocks form and transform. Since the Progress Build reflects an increasingly complex yet integrated explanation, we represent it by including the new ideas for each level in bold.

Prior knowledge (preconceptions). At the start of the Rock Transformations unit, middle school students will have had experience with seliment-such as and or gravel-in their daily lives. Whethir is a playeound or at the beach. They are likely to be familiar with magma or law from popular media, though they may not have considered its connection to rock formations. It is expected that students have completed the Amplify Science Plate Motion unit, or a similar unit on plate textonics that covers how tectonic plates move and interact at their boundaries. It students have had the Amplify Science grade 2 unit Changing Landforms and grade 4 unit Earth's Features, they will be familiar with the concepts of how rock break down into smaller ploces, and now sediment can move and accumulate in layers. This experience and prior knowledge can be built upon and refined, which is what the Rock Transformations Progress Build and unit structure are designed to do.

Progress Build Level 1: Rocks that form in different ways are different types of rock.

Rock formations can be made in different ways, which cause them to become different rock types. One type is made from small pieces of rock material called sediment. When the sediment gets buried and presed together, over time it hardress into one type of rock formation called sedimentary rock. Another type of rock formation is made from liquid rock material called magma; when it cools, it hardress into a rock type called igneous rock.

Progress Build Level 2: Material for rock formations can come from rock formations that are weathered or melted.

Rock formations can be made in different ways, which cause them to become different rock types. One type is made from small pieces for oke material called sediment. When the sediment gets buried and presed together, over time it hardress into one type of rock formation called sedimentary rock. Another type of rock formation is made from liquid rock material called magma; when it cools, it hardress into a rock type called (greous rock. The material that forms new rock comes from existing rock formations. Sediment is small pieces of rock that have been broben down from a rock formation at the surface of Earth. The small pieces are created by the movement of wind and water. The energy for this comes from the sun, and therefore these processes can only happen at the surface, where there is sun energy, air, and water. The metled rock (magma) that hardress to form new rock comes from existing rock throma deep below the surface of Earth. These rock Earth metls the existing rock throm agma.

Part 1: Unit-level internalization

Unit title: Rock Transformations

What is the phenomenon students are investigating in your unit?

A rock sample found in the Great Plains and a rock sample found in the Rocky Mountains look different but are composed of a surprisingly similar mixture of minerals.

Unit Question:

How do rocks form and change?

Student role:

Student geologists

By the end of the unit, students figure out ...

The two rock samples originated together (which is why they have similar mineral composition), but today they are different types of rock that were moved to different places and transformed through different geological processes.

What science ideas do students need to figure out in order to explain the phenomenon?

Rocks that form in different ways are different types of rock. Material for rock formations can come from rock formations that are weathered or melted. Rock formations can move between Earth's surface and its interior, which can lead to their transformation.

Breakout groups

In breakouts, discuss the unit content we've worked on.

What's interesting, compelling, or exciting?

What are you still wondering?

Planning for the Unit

Unit Map

Why are rock samples from the Great Plains and from the Rocky mountains composed of such similar minerals, when they look so different and come from different areas?

Taking on the role of student geologists, students investigate a geologic puzzle: two rock samples, one from the Great Plains and one from the Rocky Mountains, look very different but are composed of a surprisingly similar mix of minerals. Did the rocks form together and somehow get split apart? Or did one rock form first, and then the other rock form from the materials of the first rock? To solve the mystery, students learn about how rock forms and transforms, driven by different energy sources.

Chapter 1: How did the rock of the Great Plains and the rock of the Rocky Mountains form?

Students figure out: The rock of the Great Plains is sedimentary rock and the rock of the Rocky Mountains is igneous rock. They formed in different ways so they must not have formed together. Rocks can form in different ways. This causes them to be different types. When sediment is compacted and cemented together, it forms sedimentary rock. When magma cools, it hardens to form igneous rock.

How they figure it out: They observe rock samples and explore the Simulation, finding different ways to make rock form. They model the formation of sedimentary rocks using hard candy, and view a video showing igneous rock formation as magma cools. They create a visual model showing two different ways rocks can form. They evaluate evidence based on how detailed observations are.

Amplify.

Key Activities

- Introducing the Geologic Puzzle: Students are introduced to the unit problem and their role as student geologists.
- Observe: Students make detailed observations of four different rock samples (basalt, conglomerate, sandstone, and granite) shown in a video.

Ideas for synchronous or in-person instruction

Before meeting, have students watch the introductory video. While meeting, have students share their initial ideas. If you have access to kit materials, you could have students make observations of the rocks while you display them, allowing students to ask you questions about things they cannot observe directly such as hardness and texture.

Rock Transformations

@Home Lesson 1

AmplifyScience

Today, we will begin a new unit called *Rock Transformations*. Let's begin by thinking about this question:

How do you think rocks form?

In this unit, we will investigate **how rocks** form.

Then, we'll look at how they **transform**, or change.

In the Rock Transformations unit we will be thinking about this question: **Unit Question** How do rocks form and change?

In this unit, you will take on the role of **student geologists** working to help investigate a geological question.

Now you'll watch a video that will introduce you to the question.

Note: all videos in this @Home Unit can be viewed on a smartphone, or any other connected device.

Using the print version? Watch the video here: <u>tinyurl.com/AMPRT-01</u>

The mystery you will be investigating in this unit is based on the geology of **two real-life regions**. However, some aspects of this unit are **fictional**.

Bascom University and the characters in this video are not real. They are included in this unit to give you an opportunity to investigate **how the rocks formed** in these real-life regions in ways that are very similar to the ways that scientists would.

Nadir brought his rock sample from the **Rocky Mountains** and Corey brought hers from the **Great Plains.**

Let's look at a map showing those locations.

Locating the Rocky Mountains and Great Plains

Professor Lewis will provide evidence to help you investigate how rock samples taken from the Rocky Mountains and the Great Plains can have surprisingly similar mineral compositions.

First, let's think about what we know about the **Rockies** and the **Plains**.

Start by observing the images on the next slide of the **Rocky Mountains** and the **Great Plains**. Look for **similarities** and **differences**.

The Rocky Mountains

The Great Plains

What do you observe about the **Rocky Mountains** and the **Great Plains**?

What do you think could have caused the rock formations in the Rocky **Mountains and Great** Plains to be so **different** yet have similar amounts of certain minerals?

This question will help guide us as we think about the problem of why the rocks in the Great Plains and Rocky Mountains have similar mineral compositions.

Chapter 1 Question

How did the rock of the Great Plains and Rocky Mountains form?

Great Plains and Rocky Mountains Claims

Claim 1: They formed as one rock formation, and then something separated them.

Claim 2: One rock formation formed before the other. Then, the minerals from the older rock became part of the younger rock.

Read these **two claims** the students made about why the rocks have similar mineral compositions.

To evaluate these claims, we'll first try to figure out how the rock formed.

Thinking about Claim 1:

If the rock in the Great Plains and Rocky Mountains **formed as one rock formation**, this means they started off as one region of rock that formed together at the same time as a single rock type. **Over time**, **something** may have **separated this region**.

Thinking about Claim 2:

If one rock formed before the other, and the minerals from the older rock became part of the younger rock, that means materials from the rock of one area transformed into the rock of the other area.

Key Activities

- Introducing the Geologic Puzzle: Students are introduced to the unit problem and their role as student geologists.
- Observe: Students make detailed observations of four different rock samples (basalt, conglomerate, sandstone, and granite) shown in a video.

Ideas for synchronous or in-person instruction

Before meeting, have students watch the introductory video. While meeting, have students share their initial ideas. If you have access to kit materials, you could have students make observations of the rocks while you display them, allowing students to ask you questions about things they cannot observe directly such as hardness and texture.

Next, you'll **make observations** of four hand samples of rock.

Studying them will help you learn how to gather evidence from these kinds of samples. These hand **samples** represent different types of **rock** that are commonly found on **Earth**. You have probably seen a lot of rocks in your life and are familiar with many types of rocks.

Like everything in your room—including you, your chair, and the air around us—rocks are **matter**.

All rocks are matter. matter

anything that has mass and takes up space

All rocks are matter because they have mass and take up space.

More specifically, **rocks** are made of **minerals**, and minerals are a kind of matter.

Different rocks have different **amounts** and **types** of minerals. A rock's characteristics depend on what minerals it is made of and how that rock formed.

The rocks you will be observing are called hand samples.

a small part that is meant to show what the whole is like

A **hand sample** is a piece of a rock you can hold in your hand or analyze in a lab that can give you information about the rock formation it came from and the environment the rock formed in.

Geologists collect and study hand samples because they can be used to understand which **minerals** are in a **rock formation** and **how the rock formation formed**.

a region of rock that formed together as a single rock type

Each of the colors or group of layers you see in the Grand Canyon is a rock formation. A sample is a small piece of a single rock formation, such as the piece of sandstone in the image.

In this lesson and throughout the unit you will need to access different pages such as the Glossary on the next slide. Check with your teacher about how you will access materials and complete and submit work in this @Home Unit.

Rock Transformations Glossary (continued)

plate boundary: the place where two plates meet límite de placas: el lugar donde se juntan dos rock form Rock Transformations Glossary formació rock mat cementation: the process of sediment being glued together materiale cementación: el proceso en el que el sedimento se va pegando sample compaction: the process of sediment being buried and pressed together muestra: compactación: el proceso en el que el sedimento se va enterrando y comprimiendo sedimen cross section: a diagram that shows what the inside of something looks like sediment corte transversal: un diagrama que muestra cómo es el interior de algo sedimen energy: the ability to make things move or change roca sedi energía: la capacidad de hacer que las cosas se muevan o cambien subducti erosion: the movement of sediment from one place to another, often caused by wind or flowing mantle d water subducci erosión: el movimiento del sedimento de un lugar a otro, a menudo causado por el viento o por Tierra y h aqua que corre uplift: th igneous rock: the rock type formed when magma cools and becomes solid roca ígnea: el tipo de roca que se forma cuando el magma se enfría y se hace sólido motion levantam magma: hot liquid rock below the surface of Earth empujada magma: roca líquida y caliente bajo la superficie de la Tierra weatheri matter: anything that has mass and takes up space desgaste materia: cualquier cosa que tenga masa y ocupe espacio movimie metamorphic rock: the rock type formed when heat or pressure deep underground changes existing rock roca metamórfica: el tipo de roca que se forma cuando el calor o la presión de la profundidad subterránea cambia la roca va existente mineral: one of the many different types of matter that make up rocks mineral: uno de los diferentes tipos de materia que forman las rocas plate: one of the very large sections of hard, solid rock that make up Earth's outer layer placa: una de las muy grandes secciones de roca dura y sólida que forman la capa externa de la Tierra

Throughout the year, you can look up vocabulary words in the glossary to help you understand what they mean. You can find this in your student sheets or in the **Amplify** Library.

Rock Transformations Glossary pages or Amplify Library

It is important for geologists to make detailed observations of the rock samples. On the following slide you will find the **Geologist's Detailed Observation Guidelines.**

Keep these guidelines in mind as you observe the hand samples.

Geologist's Detailed Observation Guidelines

- 1. Observe the number and colors of grains in the rock.
- 2. Observe the sizes and shapes of grains.
- **3.** Observe whether the grains look **stuck together** or fitted together like puzzle pieces.
- 4. Observe the rock's texture, including how hard it is.
- 5. Notice whether there are **unusual features** in the rock, such as bubbles or fossils.

Rock Transformations @Home Lesson 1

Diserve the hand samples in the video and rec	cord your observations below. Note: all videos in
Watch the video here: <u>tinyurl.com/AMPRT-022</u>	
Record your observations about rock sample 1.	Record your observations about rock sample 2.
Record your observations about rock sample 3.	Record your observations about rock sample 4.

Go to the **Observing Hand Samples of Rock** activity.

As you watch the video, record your observations. You may need to watch the video a few times to make your observations.

Observing Hand Samples of Rock page or Lesson 1.2, Activity 3

Using the print version? Watch the video here: tinyurl.com/AMPRT-022

Let's think about the rock samples you just observed.

How can you tell the rock samples apart?

What is similar about some or all of the rock samples?

Rock Transformations @Home Lesson 1

Which of your observations could be true about the whole rock formation, and which are probably only true about the sample?

You might have thought of ideas like these:

- If the sample is hard, the whole rock formation is hard.
- If the sample has rounded edges, that does not mean the whole rock formation has rounded edges.

We will continue investigating how rocks form in the next lesson. Rock Transformations @Home Lesson 1

End of @Home Lesson

Key Activities

- Introducing the Geologic Puzzle: Students are introduced to the unit problem and their role as student geologists.
- Observe: Students make detailed observations of four different rock samples (basalt, conglomerate, sandstone, and granite) shown in a video.

Ideas for synchronous or in-person instruction

Before meeting, have students watch the introductory video. While meeting, have students share their initial ideas. If you have access to kit materials, you could have students make observations of the rocks while you display them, allowing students to ask you questions about things they cannot observe directly such as hardness and texture.

Suggestions for Online Synchronous Time

Online synchronous time

Online discussions: It's worthwhile to establish norms and routines for online discussions in science to ensure equity of voice, turn-taking, etc.

Digital tool demonstrations: You can share your screen and demonstrate, or invite your students to share their screen and think-aloud as they use a Simulation or other digital tool.

Interactive read-alouds: Screen share a digital book or article, and pause to ask questions and invite discussion as you would in the classroom.

Shared Writing: This is a great opportunity for a collaborative document that all your students can contribute to.

Co-constructed class charts: You can create digital charts, or create physical charts in your home with student input.
